1 List of Modules and Courses

1.1 Overview of the Modules

Module	SWS	\mathbf{CP}
required modules		
Experimental Physics	3 V + 1 Ü	6
Theoretical Physics	$4 V + 2 \ddot{U}$	9
Seminars	4 S	8
Advanced laboratory course	8 P	10
sum		33
Research Phase		
Specialization	\mathbf{F}	15
Methodological Knowledge	\mathbf{F}	15
Master thesis	\mathbf{F}	30
sum		60
$Elective\ Modules$		
Topical Courses	$6 \text{ V} + 2 \ddot{\text{U}}$	12
Advanced Course	3 V + 1 Ü	6
Research Module	4 V	6
to choose		12-18
Subsidiary Subject	t	
Subsidiary Subject (cf. chapter 1.4)		9-15
to choose		9-15
Total		120

1.2 List of Topical Courses

Only the following courses can be chosen in the "Topical Courses" module:

- Condensed Matter Physics
 - Selected Topics in Condensed Matter Physics
 - Modern Experimental Methods in Condensed Matter Physics
 - Materials Science
 - Introduction to Advanced Materials from soft matter to hard matter
 - Quantum Spintronics
 - Superconductivity
 - Nonequilibrium phenomena in quantum matter
 - Introduction to Condensed Matter Theory
 - Selected Chapters of Condensed Matter Theory
 - Theory of Soft Matter I
 - Modern Computational Techniques in Condensed/Soft Matter Physics
 - Computer Simulations in Statistical Physics
 - Soft Materials at Interfaces
 - Biophysics
 - Advanced theoretical solid state physics
- Quantum, Atomic and Neutron Physics
 - Quantum Optics (Q-Ex-1)
 - Photonics (Q-Ex-2)
 - Quantum Information (Q-Ex-3)
 - Precision Fundamental Physics (Q-Ex-4)
- Nuclear and Particle Physics
 - Statistics, Data Analysis and Simulation
 - Particle Detectors
 - Accelerator Physics
 - Particle Physics
 - Astroparticle Physics
 - Cosmology and General Relativity
 - Symmetries in Physics
 - Modern Methods in Theoretical High Energy, Particle and Nuclear Physics
 - Theoretical Particle Physics
 - Theoretical Nuclear Physics
 - Introduction to Lattice Gauge Theory
 - Introduction to String Theory
 - Effective Field Theories

- $\ \, {\it Theoretical Astroparticle Physics}$
- $-\,$ Amplitudes and Precision Physics at the LHC
- $-\,$ Functional Methods and Exact Renormalization Group

1.3 List of Advanced Courses

Every topical course (cf. 1.2) can also be chosen as an advanced course. In addition the following courses can be chosen:

- \bullet Condensed Matter Physics
 - Theory of Soft Matter II
- Nuclear and Particle Physics
 - Advanced Particle Physics
 - Advanced Chapters on Subatomic Physics
 - Advanced Astroparticle- and Astrophysics
 - Advanced Accelerator Physics

1.4 Subsidiary Subjects

Subsidiary Subject	SWS	\mathbf{CP}
Chemistry		
Nuclear Chemistry	$2 \text{ V} + 1 \ddot{\text{U}} + 5 \text{ P}$	9
Nuclear Chemistry (with 1 additional advanced lecture)	$4 \text{ V} + 1 \ddot{\text{U}} + 5 \text{ P}$	12
Nuclear Chemistry (with 2 additional advanced lectures)	$6 \text{ V} + 1 \ddot{\text{U}} + 5 \text{ P}$	15
Introduction in Theoretical Chemistry	$4 \text{ V} + 1 \ddot{\text{U}} + 5 \text{ P}$	9
Theoretical Chemistry	$4 \text{ V} + 2 \ddot{\text{U}} + 10 \text{P}$	12

Fundamentals of Atmospheric Hydrodynamics	4 V + 3 Ü	10
Philosophy		
Modern Philosophy	6 S	15
Interdisciplinary Courses		
History of Natural Science I	3 V	3
History of Natural Science II	3 V	3

1.4.1 Further Subsidiary Subjects

It is also possible to choose "Physics" as subsidiary subject which allows for advanced courses as well as additional theoretical or experimental physics courses.

Upon request additional subsidiary subjects can be added from other faculties of the university. Those need to be approved by the corresponding committee ("Fachausschusses für Studium und Lehre Physik") and a dedicated contract has to be established with the faculty. The proposed subsidiary subject should be related to either natural sciences or mathematics. It is therefore advised to consult the head of the exams committee before filing such a request.

2 Important Remarks

2.1 General Remarks

- 1. The language of all physics courses is English unless all participants are proficient in German and there is a consent to hold the course in German.
- 2. Within the Master of Science in Physics studies, a minimum of 120 credit points (CP) must be obtained. If the number of credit points is exceeded by more than 6 CP, the study advisor has to be contacted to discuss the situation.
- 3. Before completion of the master studies either
 - a) all three experimental physics courses (Ex-5a, Ex-5b, Ex-5c) and 5 main courses in theoretical physics
 - b) or at least two of the three experimental physics courses and 6 main course in theoretical physics

have to be completed successfully. In case only one of the experimental physics courses was part of the bachelor studies a corresponding requirement will be issued at the time of admission to the master studies.

- 4. Within the subsidiary subject at least 9 credit points have to be obtained. On request, subsidiary subjects not listed in this document may be chosen among courses given at the Johannes Gutenberg-Universität Mainz, the TU Darmstadt or the Goethe-Universität Frankfurt. Please consult the chair of the examination committee before submitting such a request. While many subsidiary subjects will only be given in German, it is worth asking the docent to provide the lectures in English if there is a need.
- 5. The 6 credit points from the "Advanced Lectures" module can be replaced with 15 CP instead of 9 CP in the subsidiary subject.
- 6. In case all three experimental physics lectures (Ex-5a, Ex-5b, Ex-5c) were completed successfully before the start of the master studies, an additional advanced course has to be taken.
- 7. Equivalent courses taken at other universities may be recognised with the credit points awarded for the corresponding course in Mainz. Moderate additional requirements may be imposed.
- 8. Upon request, the second course of the "Topical Courses I/II" module may be replaced with a 4 hour main course in theoretical physics.
- 9. Each course in the "Topical Courses I/II" module can be chosen instead of a course in the "Advanced lectures" module but not vice versa. This choice has to be taken at latest at the end of the 3rd enrolment phase through the corresponding enrolment via the "Topical Courses I/II" or the "Advanced Lectures" module.
- 10. The interdisciplinary course (3 CP) is optional. In addition to the courses listed in this document, also courses from the "Studium Generale" and internships ("summer student programmes") at large research laboratories may be accepted. Language courses outside of "Studium Generale" or internships in industry or research institutes can only be recognised after consulting the study

advisor. The credit points are added to the points for the subsidiary subject and in total a maximum of 15 credit points can be obtained.

- 11. The research module is designed for students who wish to take more advanced courses, i.e. from a graduate school. This module may be chosen instead of the "Advanced Lectures" module.
- 12. Courses with only two hours per week cannot be credited towards the degree. They can be listed in the transcript of records under the category "other achievements" in case there is a course assessment.

2.2 Rules and regulations

The academic rules and regulations of the MSc program in physics at the Johannes Gutenberg University Mainz are summarized in the so-called "Prüfungsordnung" – or in short – "PO" (see https://www.studium.fb08.uni-mainz.de/downloadcenter-physik/). As a legal document, it needs to be formulated in German. However, we are summarizing some important points (and pit-falls) below in English.

2.2.1 Introductory remarks

- If you have questions, you should first contact the student advisor ("Studienberater") or the manager of studies ("Studienmanager") via our contact form http://helpdesk.fb08.uni-mainz.de/?l=1. The office of student affairs ("Studienbüro", Staudingerweg 7, room 05 430, 10-12 pm Mondays to Thursday) is responsible for transcripts and certification documents, maintains recognized achievements in Jogustine and accepts applications to the Examination Board.
- A module may comprise several courses, such as teaching classes, exercises and labs. In the MSc program, a module typically consists of lecture sessions and exercise classes.
- All modules in the MSc program are graded based either on written exams, oral exams, presentations, reports on projects, or laboratory work.
- German grades are on a scale of 1.0 (best possible grade) to 4.0 (lowest passing grade). 5.0 is a failing grade. A popular formula to translate your grade into that of the German system is the so-called modified Bavarian formula

$$\frac{N_{max} - N}{N_{max} - N_{min}} \cdot 3 + 1.$$

Where N_{max} is the highest possible grade in your home country's grading system, N_{min} is lowest possible passing grade in your home country's grading system and N the grade you want to convert.

2.2.2 How to register for a class and an exam?

At the JGU, we offer – with a few exceptions – a two-step registration process.

- At the end of the preceding term, in the week before the term starts and during the first week of lectures, students register their classes via Jogustine https://www.info.jogustine.uni-mainz.de/anmeldephasen/lehrveranstaltungsanmeldephasen/. You may drop out of a class without problems.
- Around mid-term, however, Jogustine will allow you for two weeks to register for the exam if you opt for this. The registration periods can be found here: https://www.info.jogustine.

uni-mainz.de/anmeldephasen/pruefungsanmeldephasen/. Such a registration is binding! Note that our department allows you retract from your registration, as long as you do it 1 week (1pm) before the exam is scheduled.

• After expiry of the registration or de-registration deadlines, a withdrawal is only possible in justified individual cases. This applies, for example, if you have been sick and this fact is proven by a medical certificate.

2.2.3 What happens if you fail an exam and have to repeat?

- Failed *compulsory* and *elective* module examinations may be repeated at most twice. An oral supplementary examination may, however, be approved by the examination committee following a written application to the examination board. A grade of 4.0 will be given in case the supplementary exam has been passed.
- It is not allowed to repeat an exam that was passed before.
- Students who have not passed a compulsory elective module examination may switch to a different elective module after having failed one, twice or three times. For the new elective module, the student receives three more attempts to successfully complete the exam.
- The registration for the first repetition of a module examination or partial module examination should take place within six months after the failure and the second repetition of the exam should take place within twelve months of the failure of the first repetition; the registration.
- The registrations are performed automatically by the examination office, unless the exam has been passed in the mean-time.
- Only in justified cases, longer deadlines may be granted for the first and a second repetition. However, the time period may not exceed one year and nine months. If the deadlines to repeat the examinations have been missed, the exams are considered failed.
- If an examination can no longer be repeated, the Master's program is considered failed and the continuation of studies in the same master's program is no longer possible in a German University.

2.2.4 What happens if you fail to participate in an exam or withdraw from the exam?

- If the candidate does not appear to a duly established and notified appointment without good reasons or he or she steps back from the exam without valid reasons, the grade is rated as "not sufficient" (5,0).
- Exams are also considered failed if the candidate did not complete the exam or file a written report (e.g. the Master's thesis) within the prescribed time limits.
- If you disagree with the decision, the reasons for the failure or withdrawal need to be promptly notified in writing to the examination board and made credible. Should the Examining Board recognize the reasons, the exam will be re-scheduled.
- If the candidates fails to appear or withdraws from the exam because of illness, this must be proven by a medical certificate at the latest by the third day after the exam date.

2.3 Recognition of achievements

Achievements obtained in other study programs in Mainz or abroad can be recognized if there is no significant difference with respect to corresponding achievements within the MSc in physics in Mainz. Within the recognition achievements can be combined or split in order to match the formal criteria on e.g. needed credict points. Each case will be looked at individually and discussed with the applicant. The corresponding recognition form to be filled out can be found here:

http://www.studium.fb08.uni-mainz.de/downloadcenter-physik/

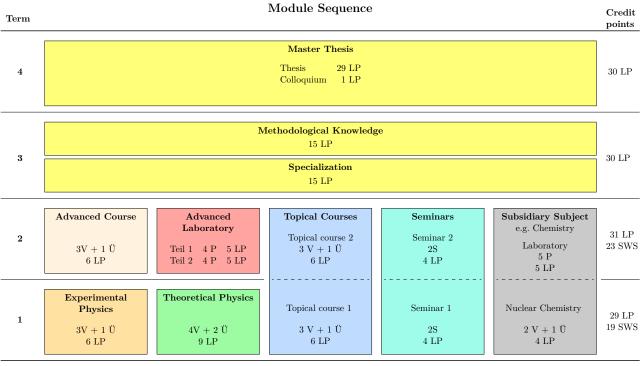

2.4 Remarks Concerning Research Phase

- 1. The research phase of the Master of Science in Physics programme consists of the three modules "Specialization" (3 months, seminar talk without grades, 15 CP), "Methodological Knowledge" (3 months, graded either through a seminar talk or a portfolio of documents representing the work, 15 CP) and "Master's Thesis" (6 months including a colloquium, 30 CP). These three modules are considered as one unit and have to be completed consecutively within one year.
- 2. Students are allowed to enrol into the research phase if at most one of the required courses to reach the 60 CP is missing (e.g. the "Advanced Lectures", one of the two lectures from "Topical Courses I/II" or one of the two seminars). The start of the master thesis is 6 month after the start of the research phase. At this point in time, at least 60 of the required credit points (§6 subparagraph 2) have to be collected.
- 3. As the module "Specialization" is part of the preparation towards the master's thesis, it cannot be taken in parallel to the 6 months long Master's Thesis module.
- 4. A change of the master's thesis advisor can only happen once. This change has to be done before the start of the module "Methodological Knowledge".
- 5. The enrolment into the research phase is processed by the "Studienbüro Physik" with the help of this form¹. The "Studienbüro" will then take care of the actual enrolment inside Jogustine.
- 6. A master's thesis outside the department of physics, mathematics and computer science (08) has to be requested (please submit an informal request at the Studienbüro). The primary evaluation of an external master's thesis has to be provided by a professor of the department 08.
- 7. The end date of the master's thesis may be extended by at most 4 weeks by the chair of the examination committee. For this to happen, the candidate has to submit a justified written request to the "Studienbüro" which has also to be signed by the corresponding thesis advisor.
- 8. The "Studienbüro" will enter the mark for the module "Methodological Knowledge" into the system at the end of the one-year research phase. The thesis advisors are requested to submit the mark of the module "Methodological Knowledge" when handing in the primary evaluation to the "Studienbüro".
- 9. In case the master's thesis is failed, the module can be repeated once. The new subject of the master thesis has to be sufficiently close to the subjects of the "Specialization" and "Methodological Knowledge" modules.

2.5 Example for Module Sequence

The following table showes an example for the module sequence for students starting in the winter or in the summer term:

 $120 \mathrm{\,LP}$

3 Detailed description of the Modules and Courses

3.1 Experimental Physics

At	omic and Quantum Phys	ics			
(JOC	number GU-StINe) 128.050	Workload (workload) 180 h	Course Duration (laut Studienverlaufsplan) 1	Designated term (laut Studienverlaufsplan) 1	Credit Points (LP) 6 LP
1.			3 SWS/31.5 h 1 SWS/10.5 h	Self-study 138 h	Credit Points 6 LP
2.	Group sizes Lecture: unlimited Excercises: 20				
3.	 Qualification and program goals / Competences Students should acquire a basic knowledge on the physics of atoms, molecules and quanta, understand the structure of atoms and simple molecules as well as their interactions with quanta, apply quantum mechanical approaches to practical examples and thus deepen their understanding, achieve insights into modern experimental techniques in atomic physics, spectroscopy and the manipulation of quantum systems by coherent radiation 				
4.	Course content Profound introduction to the experimental quantum physics of atoms and molecules and their interaction with light. The strong experiment-theory interlink in this field is detailed and can be supported by the embedding of guest lectures. The lectures cover the following set of topics: • relativistic effects and Dirac equation for the hydrogen atom, influences of the atomic nucleus, atoms in external fields				
	• atoms in laser fields – lig		,		•
	many electron systems, formanipulation and trappingas well as Bose Einstein of	ng of neutral atom			
5.	Applicable to the following program BSc. Physics, MSc. Physics	ns	cs		
6.	Recommended prerequisites				
7.	Entry requirements				

\mathbf{At}	Atomic and Quantum Physics					
(JO	number GU-StINe)	Workload (workload) 180 h	Course Duration (laut Studienverlaufsplan) 1	Designated term (laut Studienverlaufsplan) 1	Credit Points (LP) 6 LP

Relativis sics and aimed at hadron p	Qualification and program goals / Competences Relativistic quantum field theory constitutes the foundation of the Standard Model of particle physics and is essential for an understanding of modern particle and hadron physics. This lecture is aimed at theoretical interested students who would like to make a start in the field of particle and hadron physics. The lecture provides the basic tools of relativistic quantum field theory. Subsequent specialized lectures may build on these basic tools.						
Path int interaction	Course content Path integrals, Grassmann numbers, quantization of the Klein-Gordon field, Dirac, Maxwell an interacting fields, Wick's theorem, Feynman rules, cross sections, S-matrix, LSZ-reduction formula basics and outlook of non-abelian gauge theories and spontaneous symmetry breaking.

	Group sizes Lecture: unlimited Excercises: 20							
3.	Qualification and program goals / Competences Students will get to know advanced concepts and applications of statistical physics. They will learn central concepts on how to describe systems and materials whose behavior is dominated by large fluctuations, such as liquids in general, many plastics, most biomaterials, but also systems beyond the scope of natural sciences (e.g. in finance). The focus lies on general overarching principles, such as symmetries, cooperative processes and phase transitions, scales and scale free behavior, as well as coarse-graining. Specific examples will be selected based on the current research topics in Mainz and will to a large extent be related to soft matter.							
4.	 Course content Basic concepts in a statistical description of complex systems at equilibrium and non-equilibrium, linear response and transport, stochastic processes, structure, correlations, and scattering; Modeling concepts, symmetries and conservation laws, coarse-graining concepts (reduction of degrees of freedom); 							
	• Phase transitions, mean-field approaches, Landau theory, fluctuations and critical exponents, scale invariance and renormalization, and (possibly) basic concepts of statistical field theory;							
	Other topics are selected by thermodynamics, stochastic Reynolds numbers, statistic membranes, liquid crystals biomaterials), as well as in	c thermodynamics, cal physics of compl s, colloidal systems	disordered systems a ex soft matter (e.g., s, charged systems,	and glasses, hydrody polymers, self assem entangled systems,	namics at low bling systems, biomolecules,

Th	eoretical quantum optics	and many body	physics				
(JOG	number GU-StINe) 128.175	Workload (workload) 270 h	Course Duration (laut Studienverlaufsplan)	Designated term (laut Studienverlaufsplan)	Credit Points (LP) 9 LP		
1.	Courses/Teaching methods Lecture with excercises ,, tum optics and many body Lecture (WP) Excercises (WP)	_	Contact time 4 SWS/42 h 2 SWS/21 h	Self-study 207 h	Credit Points 9 LP		
2.	Group sizes Lecture: unlimited Excercises: 20						
3.	 Qualification and program goals / Competences After this course, the students should amongst others: be able to apply advanced methods of Theoretical Quantum Physics, be familiar with the interpretation, examination and formulation of quantum field theories, have a deeper understanding of the most important phenomena and models of many-particle theory and theoretical quantum optics This is to create a solid basis to deal with research-related topics in the field. 						
-	Course content The course offers a profound theoretical introduction to the overlapping fields of theoretical many particle physics, quantum optics and solid state quantum theory. It also offers an introduction to quantum information, ultracold gases and photonics. The strong theory-experiment interlink I this research area is supported by the possible embedding of focused experimental guest lectures into the course. Selection of topics: Introduction: 1-particle and many-body Schrödinger equation, spin and its physical consequences, fermions and bosons, Green functions						
	• Quantum many-body theory: creation and annihilation operators, observables, quantum field theory, applications (interacting Fermi gas, interacting Bose gas, ultra-cold quantum gases, 4He), coherent states, path integrals						
• Quantum theory of the electromagnetic field: classical Maxwell field, Lagrange and Harformalisms, quantization of the electromagnetic field, interaction of the electromagnetic field matter, Casimir effect, Rayleigh and Thomson scattering, Raman effect							
	• Quantum optics: photon states, atoms in cavities,	, <u>-</u>	Ο,	, -	· ,		
	• Methods and models of quoperator identities and badistributions, dissipative	asis states, quantu	m statistics, characte	eristic functions, qua	si-probabilit

2.	Group sizes typical 2 student working o	n the same laborat	tory experiment				
3.	Qualification and program goals / Competences This modul shall lead the students to advanced experimental and numerical-theoretical work in modern physics. At the same time they should get insight in the actual reseach activities at the institute. This is realized in the form of challenging projects in a research group of free choice and under the supervison of experienced assistants. Compared to the bachelor advanced laboratory course there is a stronger emphasis on independent work and actual research.						
4.	Course content The format of these projects is quite flexible with respect to topic, implementation and timing. However it must be approved by the course convenor. Mandatory requests are that the topic includes modern physics, the duration does not exceed 60h of lab work, and that there is no thematic overlap neither with the bachelor thesis nor the other project in this module. Projects can be performed in all research groups with a focus on modern physics. Research at external institutions (e.g. major research institutions) is possible.

2.	Group sizes Lecture: unlimited Excercises: 20						
3.	Qualification and program goals / Competences Students shall be guided towards a selection of special problems in modern Condensed Matter Physics to obtain a solid background when dealing with research related topics. Magnetism and super conductivity emerge through the correlated dynamics of electrons in solids and provide the basis of modern electronics and information technology. Surface Science is essential for an in depth understanding of miniaturized devices as well as for novel diagnostic techniques. Soft Matter shows fascinating structural and dynamic properties and nurtures a rapidly developing field of applications. Its fundamental scientific questions also related to other disciplines like biology, chemistry and medicine. By an depth treatment of one or more of these topics, the course will provide a solid basis for conducting a master thesis in the area of Condensed Matter Physics.						
4.	Course content Depending on the lecturer, the course will focus on specific topics, such as magnetism, super conductivity, heavy fermions, applied solid state physics, surface science or soft matter physics						
5.	Applicable to the following programs MSc. Physics						
6.	Recommended prerequisites Knowledge of experimental physics on the level of the module Experimental Physics "Physics of Condensed Matter"

4.	Qualification and program goals / Competences Den Studierenden sollen die physikalischen Grundlagen des Magnetismus von klassischen makroskopischen Beschreibungen bis zum quantenmechanischen Einzelspin nahe gebracht werden. Insbesondere soll ein Verständnis erzielt werden, wie einzelne Elektronen im Festkörper durch die Austauschkopplung zu einer makroskopischen Magnetisierung führen. Die Dynamik von Spins wird klassisch als auch quantenmechanisch besprochen und Methoden zur Messung werden erklärt. Auf der Anwendungsseite wird energiesparende Magnetoelektronik für Speicher, Sensorik und Logik eingeführt und Spin-basierte Qubits werden erklärt. Studenten werden die Konzepte von emergenten Phänomenen und den Übergang von klassischen und quantenmechanischen Effekten im Beispiel des Spin verstehen und das Anwendungspotential abschätzen können. An einem oder an mehreren speziellen Themen soll ein vertieftes Verständnis für ein forschungsnahes Spezialgebiet der kondensierten Materie entstehen, das eine gute Grundlage darstellt, eine Masterarbeit erfolgreich durchführen zu können. Course content Einzel-Spins und resultierende magnetische Momente, Spin Ensembles und thermodynamische Effekte, Kopplung von Spins, Spindynamik, Mikromagnetismus, Spin Torque Effekte, Spin Transport und Magnetowiderstandseffekte, Realisierung von QuBits mit Spins, Messmethoden für Spins, Anwendungen von Spin.

2.	Group sizes Lecture: unlimited Excercises: 20						
3.	Qualification and program goals / Competences The students should get acquainted with the physical foundations of superconductivity. In particular they should understand how the independent individual electrons in a solid condense into a macroscopic quantum state, what is the symmetry of the order parameter, and how the order parameter is determined. An understanding of the transport properties of the superconducting ground state shall be achieved with respect to the possibilities of dissipation free transport and the realization of superconducting quantum phenomena as ultrasensitive sensors or qubits. In one or several special topics a deeper understanding of a subfield of current research in solid state physics shall be achieved forming the foundation to successfully prepare a master thesis on these topics.						
4.	Course content Electrons in solids, BCS-theory for Cooper pair formation and condensation in the ground state, phase transition and transport properties Ginzburg-Landau description, type I and type II superconductors, the Josephson effect and its applications in ultra sensitive sensors and as voltage normal, critical currents in superconductors, superconducting magnets, superconducting qubits, high temperature superconductivity, transport in two-dimensional systems, related quantum effects as Quantum Hall effect.

3.	Qualification and program goals / Competences Building on the introductory courses on quantum mechanics and statistical thermodynamics, the central concepts of the description of crystalline solids shall be discussed. Starting from lattice periodicity and crystal symmetry, concepts like the electronic structure (electrons in a crystal field potential) and elementary excitations (phonons, magnons, plasmons, etc.) and their consequences for the various physical properties of solids at low temperatures are explained, thereby creating a solid basis to deal with research-related topics in the field of condensed matter theory.							
4.	Crystal structure, symmetry, the concept "reciprocal lattice", lattice dynamics in the harmonic ap proximation, relation to the elastic constants, electrons in a crystal field (Bloch wave and Wannie functions, energy bands, etc.), basic concepts of magnetism, magnons, etc. Also, depending on the choice of the lecturer, selected advanced topics (e.g., scattering theory of solids, electron-phonon interaction, plasmons and dielectric response, etc.) are presented.							
5.	Applicable to the following promotes MSc. Physics	ograms

Soft matter interfaces are ubiquitous in life and technology, see for example, OLED displays on smartphones, soap bubbles, many biological tissues. Particular emphasis is given to the links connecting intermolecular forces with molecular scale structure and physical materials properties. The course further introduces the experimental techniques required to study soft matter interfaces on the relevant time and length scales. Focus is set to scattering and scanning probe techniques, providing complementary information in real and reciprocal space. The course will enable the students to understand numerous physical phenomena surrounding us in everyday live while also providing them with the basic knowledge for improving the performance of modern soft materials for specific applications. Examples help to develop a deeper understanding

2.	Group sizes Lecture: unlimited Excercises: 20		1 2 11 2 1 2 1 2			
3.	Qualification and program goals / Competences The lectures introduce the basic ideas of the effective field theory approach like relevant and irrelevant operators, renormalization group, decoupling of heavy particle. The lectures also provide a deeper understanding of its most important applications in modern research fields.					
4.	Course content The method of effective field theory provides a systematic approach to multi-scale problems. An effective field theory uses the appropriate degrees of freedom to describe the phenomena at a given energy scale, while all degrees of freedom only relevant at much higher scales are eliminated from the theory. These concepts lead to a large variety of phenomenological applications in modern particle physics. Especially in the theory of strong interactions with its different behaviour at the various energy scales the important examples of the electroweak Lagrangian, heavy-quark-effective theory, and soft-collinear-effective theories allow for most suitable descriptions of the respective theoretical systems.

	Qualification and program goals / Competences The first objective of the course is to understand spin-polarized ensembles. Later-on, we will discuss their behavior under the conditions of relativistic motion in macroscopic external fields. This regime is governed by the Thomas-BMT equation. The spin dynamics in spin rotators, recirculating linear accelerators, but also in particular for synchrotrons and storage rings will be discussed. The second part is devoted to the realization of spin-sensitive experiments at accelerators which are of course based on the interaction of spins with microscopic fields. Information on these interactions may be obtained by measuring spin sensitive observables, e.g. the analysing power of the process. The presentation of experimental techniques such as polarized sources and polarimeters concludes the course. The course provides the background to successfully complete a master's thesis in the groups at MAMI that deal with experiments based on spin-polarized beams.						
4.	Course content The course will provide knowledge and competence with respect to the following subjects: Spin polarized ensembles, density matrix, Dirac' equation, spin precession in the lab frame (Thomas BMT equation), single pass spin rotators, sibirian snakes, intrinsic and imperfection resonances in storage rings, Sokolov-Ternov effect, spinstable solutions, depolarization by synchrotron radiation, spin equilibrium, spin polarized sources, spin sensitive observables (analyzing powers), polarimetry parity violating observable, Parity violation experiments at accelerators, double polarization experiments with polarized targets at collider facilities.

3.6.2 Computer Science

Remarks:

The introductory courses "Einführung in die Programmierung", "Einführung in die Softwareentwicklung", as well as "Technische Informatik" cannot be chosen as part of these modules.

Courses belonging to the theoretical foundation ("Theoretische Grundlagen der Informatik I + II", "Datenstrukturen u. effiziente Algorithmen") as well as the ones belonging to the focus subjects can be chosen.

The following courses are regularly offered: Computergrafik (Computergrafik Teil I + II, Echtzeitbild-verarbeitung, 3D Computer Vision) Informationssysteme (Datenbanken Teil I + II) Datenanalyse (Datenwarehouse + Data-Mining) Modellbildung + Simulation Clientseitige Webanwendungen + Serverseitige Webanwendungen Datenstrukturen u. effiziente Algorithmen Betriebssysteme + verteilte Systeme Kommunikationsnetze Software-Technik.

3.6.3 Economics

Within the subsidiary subject Economics one out of the following three branches can be selected: "International Economics & Public Policy", "Finance & Accounting" and "Marketing, Management & Operations". In each branch two modules must be successfully completed.

- Branch 1: "International Economics & Public Policy"
 - International Trade
 - Mikroökonomie II
 - Öffentliche Finanzen
 - Wirtschaftspolitik
 - Intertemporale Optimierung
 - Mikroökonometrie
 - Exchange Rates
 - Makroökonomie II
 - Zeitreihenanalyse
- Branch 2: "Finance & Accounting"
 - Rechnungslegung
 - Steuern
 - Finanzen
 - Controlling
 - Banken
 - Zeitreihenanalyse
- Branch 3: "Marketing, Management & Operations"
 - Organisation
 - Wirtschaftsinformatik
 - Marketing
 - Logistikmanagement
